Protein Synthesis Lab 37 - Studyres

When a cell needs to make a protein, say the enzyme to digest lactose (the sugar in milk), it needs to use/read the DNA code to make proteins. We call this process protein synthesis. Protein synthesis requires the use of DNA and all three forms of RNA to read the code and make the desired protein. This occurs in two steps: Transcription; Translation

In the Protein Synthesis lab, you will learn about the difference between protein synthesis in prokaryote (using E. coli) and eukaryote (using CHO cells). Prepare recombinant Erythropoietin and use the mass spectrometer. Your first task in the lab will be to prepare recombinant Erythropoietin that is transfected into E. coli and CHO cells.

Virtual Lab: Protein Synthesis Virtual Lab | Labster

One such method is called Solid Phase Peptide Synthesis. However, the size of the protein will limit the use of this technique due to the yield at each step. For example, consider a 100 residue protein with each addition having a yield of 99%. Unfortunately, the end yield is going to be roughly $0.99^{99} = 37\%$.
