the Sun. The photosphere is the visible surface of a star and is the layer to which the surface temperature and radius apply. Constantly changing features appear there.

Structure of Stars | Scholastic

A star is an astronomical object consisting of a luminous spheroid of plasma held together by its own gravity. The nearest star to Earth is the Sun. Many other stars are visible to the naked eye from Earth during the night, appearing as a multitude of fixed luminous points in the sky due to their immense distance from Earth.

Star - Wikipedia

The stars : their structure and evolution. [R J Tayler] -- This text examines how knowledge of many branches of physics can help provide an understanding of the structure and evolution of stars. Topics covered include: observational properties of stars, ...

Galaxy - Galaxy - Types of galaxies: Almost all current systems of galaxy classification are outgrowths of the initial scheme proposed by the American astronomer Edwin Hubble in 1926. In Hubble's scheme, which is based on the optical appearance of galaxy images on photographic plates, galaxies are divided into three general classes: ellipticals, spirals, and irregulars.
